CERTIFICATION  
**Quality Management System**  
**Certificate of Approval**

This is to certify that the QMS of

**M/S IKL BEARINGS INDIA PRIVATE LIMITED**

HNO. 286, GORUND FLOOR, NTI LAYOUT, 12TH MAIN, VIDYARANYA PURA  
BANGALORE, 560097., India

Has been assessed and found to meet the requirements of

**ISO 9001:2008**

This certificate is valid for the following scope of operations:

**Manufacturing, Procurement & Distribution of all  
Types of Bearings**

Authorised by:

**RN Cooke**  
Chief Executive

**Date of Certificate Issue: 12 March 2016**

**Certificate Valid Until: 11 March 2017**

Recertification audit before 15 February 2019. Certified since 12 March 2016.

This certificate is the property of QEC Certification and remains valid  
subject to satisfactory annual Surveillance audits.

**SN Registrars (Holdings) Limited**  
Registration House, 22b Church Street,  
Rushden, Northamptonshire,  
NN10 9YT, UK

Company number: 07659067

**Certificate Number: QEC 22387509/17/Q**

Member of SN Registrars (Holdings) Ltd

8327

IKL je osnovan 10.7.1948. od vlade Jugoslavije kao «Industrija kugličnih i valjkastih ležaja». To je bilo prvo državno preduzeće za proizvodnju ležaja u zemlji. Preduzeće je osnovano u veoma teškoj ekonomskoj situaciji, nekoliko godina posle kraja 2. svetskog rata, u vreme ratom opustošene privrede i ekonomiske blokade sa istoka i zapada.

Prve mašine su dobijene iz reparacije. Za prvi 6 meseci obučeno je 69 radnika za proizvodnju ležaja, koja je počela 1949. Prvi proizvedeni ležaji su bili 6204, 6306 and 6307.

Prva faza razvoja je trajala do 1955. kada se beleži veliki rast proizvodnje.

Od 1958 do 1962. se nabavljuju nove mašine i izgrađuje nova proizvodna hala koja omogućava dalji rast fabrike.

1968. menja ime u «Industrija kotrljajućih ležaja»

IKL je prema svojim proizvodnim kapacitetima prilagodio proizvodni program svim korisnicima kotrljajućih ležaja. IKL proizvodi, pored standardnih ležaja, i specijalne ležaje za automobile, poljoprivredne mašine, elektromotore, itd.

IKL sve tipove ležaja proizvodi u svim konstruktivnim izvođenjima i povišenim kvalitetima.

IKL, osim što proizvodi i prodaje ležaje, nudi tehničku pomoć i savete za ugradnju kao i predloge ili rešenja za konkretnе probleme izbora ležaja.

IKL is founded on 10.7.1948. by government of Yugoslavia as «Industry of ball and roller bearings». It was the first state-owned company for production of bearings in the country . The company was founded in a very difficult economic situation , a few years after the end of the 2nd World War II, during the war-torn economy and the economic blockade of the east and west.

The first machines were obtained from reparations. For the first 6 months 69 workers are trained for bearings production, which began in 1949. First manufactured bearings were 6204, 6306 and 6307.

The first phase of development took up in 1955 when it recorded a growth of production.

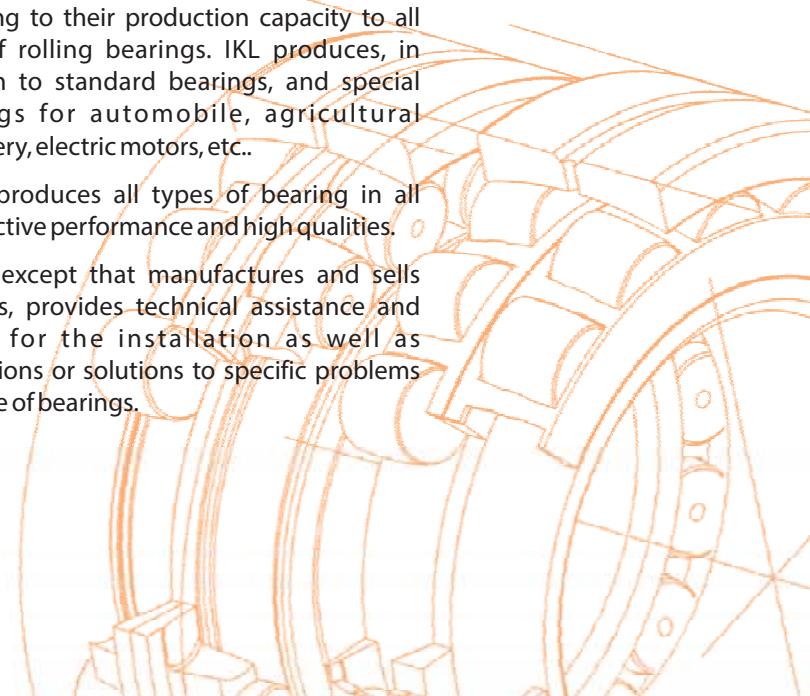

From 1958 to 1962 IKL purchased new equipment and built new production hall that allows further growth of the plant.

In 1968 changing its name to «Industry of rolling bearings».

IKL has adjusted production program according to their production capacity to all users of rolling bearings. IKL produces, in addition to standard bearings, and special bearings for automobile, agricultural machinery, electric motors, etc..

IKL produces all types of bearing in all constructive performance and high qualities.

IKL, except that manufactures and sells bearings, provides technical assistance and advice for the installation as well as suggestions or solutions to specific problems of choice of bearings.

# Spherical Roller Bearings

IKL je 1949. proizveo 1.6 t ležaja što je tada pokrivalo samo 1% tadašnjih potreba, dok je 1979. proizvedeno 5500 t što je činilo 50% potreba (oko 1 kamion dnevno).

U izvoz je išlo 15 % proizvodnje. IKL se specijalizovao u proizvodnji jednorednih kugličnih ležaja serija 60, 62 i 63 u svim modifikacijama i izvođenjima što se tiče funkcionalnosti, ugradnje i kvaliteta, jednorednih i dvorednih kugličnih specijalnih ležaja za automobile i poljoprivredne mašine.

1970. počinje saradnja sa SKF, a 1975. godine posle rekonstrukcije i proširivanja kapaciteta (fabrika ima 5000 kvadratnih metara), osvajanja konstrukcije i tehnologije SKF-a i proizvodnja novih tipova ležaja sa novim mašinama iz SKF-a. Novi tipovi ležaja su za elektroindustriju i eksploraciju, ležaji dobijaju Q6 nivo kvaliteta, proizvode se ležaji povišene tačnosti P4, P5 i P6, visokoturažni ležaji, itd.

Ovo je omogućilo da IKL snabdeva sve fabrike u Jugoslaviji i da izvozi (Italija, SAD, Poljska, SSSR, Španija, Grčka, Portugal, Egipat). IKL je bez problema prodavao sve što proizvede.

U junu 1978. IKL je sa 25 organizacija potpisao

U junu 1978. IKL je sa 25 organizacija potpisao Sporazum o saradnji što je omogućilo potpuno sagledavanje potreba domaćeg tržišta, a već 1979. godine IKL ostvaruje 37 % veću proizvodnju kao rezultat sprovođenja Sporazuma.

Zbog većeg zadovoljenja potreba tržišta, IKL donosi odluku o izgradnji nove Fabrike ležaja u Barajevu, pored Beograda (22000 kvadratnih metara, počela da radi 1983.), koja je projektovana za proizvodnju 20.5 miliona ležaja manjih gabarita, Fabrike kuglica i kaveza u Bajinoj Bašti, i manje fabrike u Prijepolju.

U tome periodu je izvršena zamena stranih zaptivača za domaće, a cevi, šipke i žice su nabavljane od domaćih željezara. Time je praktično IKL koristio sve kvalitetne sirovine domaćeg porekla i iz Ukrajine.

IKL zapošjava 2500 radnika, od toga je oko 350 radnika zaposleno u Barajevu.

Od 1980. promet IKL nastavlja sa raste po stopi od 2-3 % godišnje i dostiže cifru od 100 miliona dolara.

Kao posledica raspada bivše Jugoslavije, proces restrukturiranja ozbiljno počinje 2008.god. Većina zainteresovanih radnika je odlučila da zadrži IKL brend što je dovelo do usvajanja nove strategije razvoja.

Sada je IKL grupa visoko kvalifikovanih profesionalaca koji su fokusirani na širenje na svetskom tržištu. Od 2010. nekoliko filijala je osnovano pod IKL-ovim imenom: IKL Global FZE (UAE) – čvoriste za snabdevanje ležaja brenda IKL za azijske zemlje (Vijetnam, Indija, Bangladeš, Irak), IKL Innovations (Belorusija) – centar za istraživanje i razvoj ležaja, posebno izolovanih ležaja i ležaja za visoke vibracije, IKL Bearings India Pvt Ltd – promocija IKL ležaja u Indiji i buduće proizvodno čvoriste za ležaje za visoke vibracije u Indiji, IKL International (SAD) – koordinacija globalnog širenja IKL proizvoda, Bearing Trade House (BTH/IKL) (Bugarska) – nezavisni centar za testiranje odobren od Evropske Unije za različite testove ležaja, VTL (IKL) (Srbija) – tehnička podrška i promocija, briga o klijentima.

Srećni smo što možemo da podelimo iskustvo i znanje sa našim kupcima o našim kvalitetnim proizvodima.

IKL – «Industrija kotrljajućih ležaja» – ležaji sa poštenom kombinacijom kvalitet-usluga-cena: nova filozofija u industriji ležaja. IKL znači Inovacija-ka-lojalnosti.

IKL produced in 1949. 1.6 t of bearings which then covered only 1 % needs, while in 1979. produced 5500 t, which covered for 50% of the demand (about one truck per day).

The export went 15% of production. IKL has specialized in the production of single row ball bearings series 60, 62 and 63 in all modifications and types as far as functionality, installation and quality, one-row and two-row ball bearings for special vehicles and agricultural machinery.

In 1970 begins cooperation with SKF, and in year 1975 after the reconstruction and expansion of capacity ( factory has 5,000 square meters ), the conquest of SKF design and technology and production of new types of bearings with new machines from SKF. New types of bearings are for electrical industry and exploitation, bearings receive Q6 level of quality, there are bearings of high accuracy P4, P5 and P6, high-rev bearings, etc.

This allowed the IKL is supplying all factories in

Yugoslavia and to export (Italy, USA, Poland, USSR, Spain, Greece, Portugal, Egypt). IKL has no problem to sell all it can produce.

In June 1978 IKL, with 25 organizations, signed a cooperation agreement which allowed a complete understanding of the needs of the domestic market, and already in 1979. IKL achieves 37 % higher production as a result of the implementation of the Agreement .

Due to higher meet the needs of the market, IKL makes a decision on the construction of the new plant bearings in Barajevo near Belgrade (22000 square meters, started working in 1983.), which is designed to produce 20.5 million bearings smaller footprint, Factory for balls and cages in Bajina Basta, and small Factory in Prijepolje

In this period, the replacement of foreign seals for domestic is done, and tubes, rods and wires are procured from domestic steel mills. Practically, IKL used all the quality raw materials of domestic origin and Ukraine.

IKL employs 2500 workers, out of which about 350 workers employed in Barajevo.

From 1980 IKL turnover continues to grow at a rate of 2-3 % per year reaching the figure of 100 million dollars. Since 2008 the restructuring process has started because of breaking down former Yugoslavia. But key personal was interested to keep the IKL brand alive therefore new strategy of development of IKL was adopted.

At present IKL is a team of high skilled professionals focusing on expanding globally. Since 2010 the following subsidiaries were established under IKL name: IKL Global FZE (UAE) – as hub for supply of IKL Brand bearings to Asian Countries (Vietnam, India, Bangladesh, Iraq), IKL Innovations (Belarus) – as research and development center for bearings and particular insulated bearings and vibrating screen bearings, IKL Bearings India Pvt Ltd – for marketing of IKL bearings in India and further manufacturing hub for vibrating screen bearings in India, IKL International (USA) – for co-ordination of global expanding of IKL products, Bearing Trade House (BTH/IKL) (Bulgaria) – independent testing center approved by European Union for different tests of bearings, VTL(IKL) (Serbia) – technical support and promotion, customer's care.

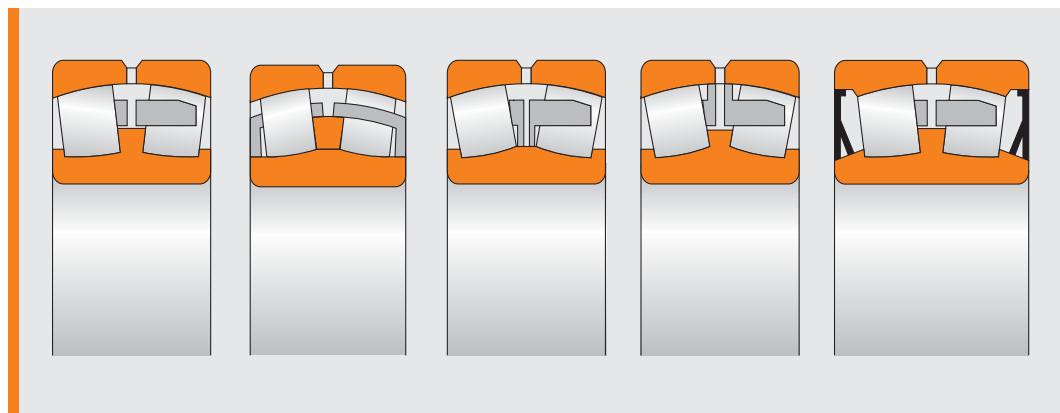

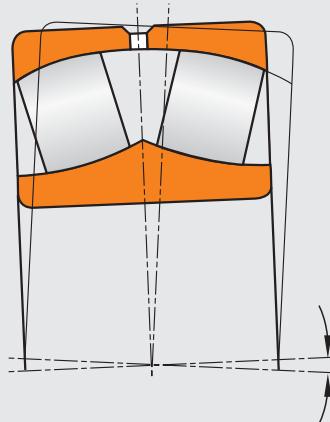

We are happy to share our experience and knowledge about our quality products with our customers.

IKL - «Industrija kotrljajućih ležaja» – bearings with fair combination of quality – service – price: new philosophy in bearing industry. IKL means Innovation - knowledge - loyalty.

# Spherical Roller Bearings

## Spherical Roller Bearings Double Row Sferno-valjkasti ležaji - dvoredni

Double row spherical roller bearings have two rows of spherical rollers with common spherical raceway in outer ring. This internal bearing design enables mutual tilting of rings. Under load the spherical roller in some designs rest by their facial surface on fixed or floating center rib, guiding the rollers. Double row spherical roller bearings are not easily separable and are being mounted as a complete unit. They can accommodate great radial and simultaneously also axial loads in both directions. Double row spherical roller bearings have either cylindrical or tapered bore and are produced with machined brass cage (M) or with steel sheet cage (J).

stěnová jíkastí ležají - dvoreční

# Spherical Roller Bearings Double Row

## Sferno-valjkasti ležaji - dvoredni

### Tapered bore

Spherical roller bearings of most series are also available with a tapered bore (taper 1:12). Bearings with a tapered bore are usually fastened on the shaft by means of adapter sleeves or withdrawal sleeves.

Bearings with a tapered bore can be mounted directly onto a tapered shaft seat. When mounting these bearings a defined radial clearance can be set.

### Bearing materials

The performance of a rolling bearing is highly influenced by the material which is used. The material of rings and rolling elements for rolling bearings is normally a low-alloy, through hardening chromium steel.

### Lubricating groove, lubricating holes

Spherical roller bearings have a lubricating groove and three lubricating holes in the outer ring to simplify lubrication. The bearings have the suffix W33.

### Pressed cages

Pressed cages are usually made of sheet. When compared with machined cages of metal they are advantageous in that they are lighter in weight. Bearings with a pressed cage have no cage suffix.

### Solid cages

Machined cages of metal are used when requirements in cage strength are strict and temperatures are high. Solid cages are also used when lip guidance is required.

## Gage design

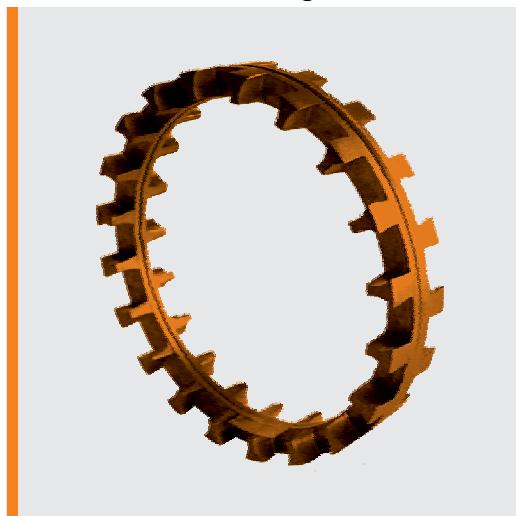

Main functions of the cage:

- Separation of rolling elements to keep friction and heat development at a minimum.
- Keeping rolling elements at equal distances for uniform load distribution.
- Retaining rolling elements in separable bearings in bearings which are swiveled out.
- Guiding rolling elements in the unloaded zone of the bearing.

Rolling bearing cages are subdivided into pressed cages and solid cages.

Another distinguishing feature of the cages is the type of guidance. Most cages are guided by the rolling elements and have no suffix for the type of guidance. Those guided by the inner ring have the suffix B.

When operating conditions are normal usually the cage design is taken which serves as the standard cage.

### Groove and Lubricating

#### Holes on Outer Ring

When double row spherical roller bearings are provided with a groove on perimeter and with three lubricating holes (W33), eventually three lubricating holes only (W20) , the lubricant can be fed straight into the bearing between two spherical roller rows. This enables to achieve better lubrication and higher operating reliability.

#### Tolerance

Double row spherical roller bearings are commonly manufactured in normal tolerance class PO. This symbol is not shown in bearing designation. Manufacture of bearings of higher tolerance class should be negotiated with the manufacturer. Limiting deviation values of dimensions and run tolerances are shown in ISO 492.

#### Radial Clearance

Currently manufactured double row spherical roller bearings are of normal radial clearance, which is not shown in bearing designation. On client's request for special purpose arrangements these bearings may be manufactured with radial clearance C2 (lesser than normal) or with radial clearance C3, C4 or C5 (greater than normal). Clearances values are shown in the next tables.

## Spherical Roller Bearings Double Row Sferno-valjkasti ležaji - dvoredni

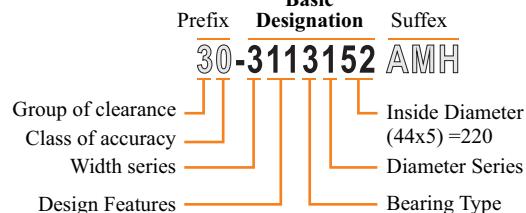

### Designation System

All bearings supplied for export under IKL brand must have international designation. International designation may have prefix, basic designation and suffix. The description of prefix, basic designation and suffix are given below. Also IKL bearings may have designation as per GOST.

#### Designation System as per DIN

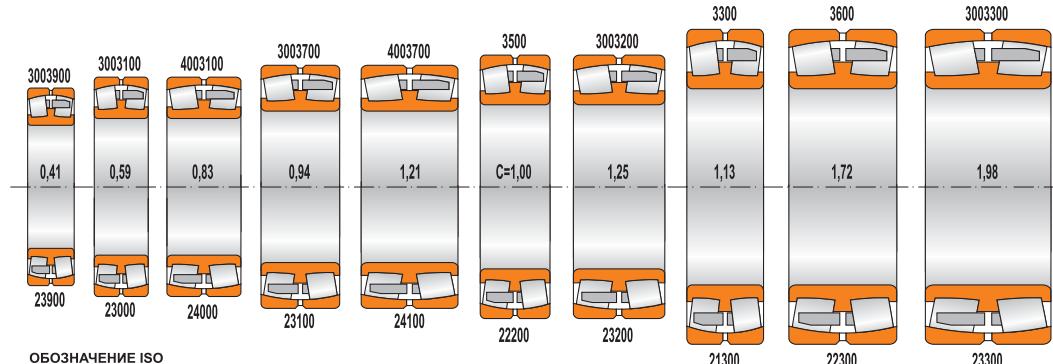

#### Designation System as Per GOST

### Additional designations (suffix)

- M - machined brass cage (two pieces cage)
- MA - cage centered on outer ring (vibrating screen bearing) K - taper bore (1:12)
- K30 - taper bore (1:30)
- C1, C2, C3 - groups of radial clearance
- SI, S2, S3 - special stabilization for high temperature application
- W33 - special lubrication grooves on outer ring

### Load Ratings of Spherical Roller Bearings depending of Width Series

## **Preparation for mounting and dismounting Cleaning contaminated**

Petroleum ether, petroleum, ethyl alcohol, dewatering fluids, aqueous neutral and alkaline cleaning agents can be used to clean rolling bearings. It should be remembered that petroleum, petroleum ether, ethyl alcohol and dewatering fluids are inflammable and alkaline agents are caustic.

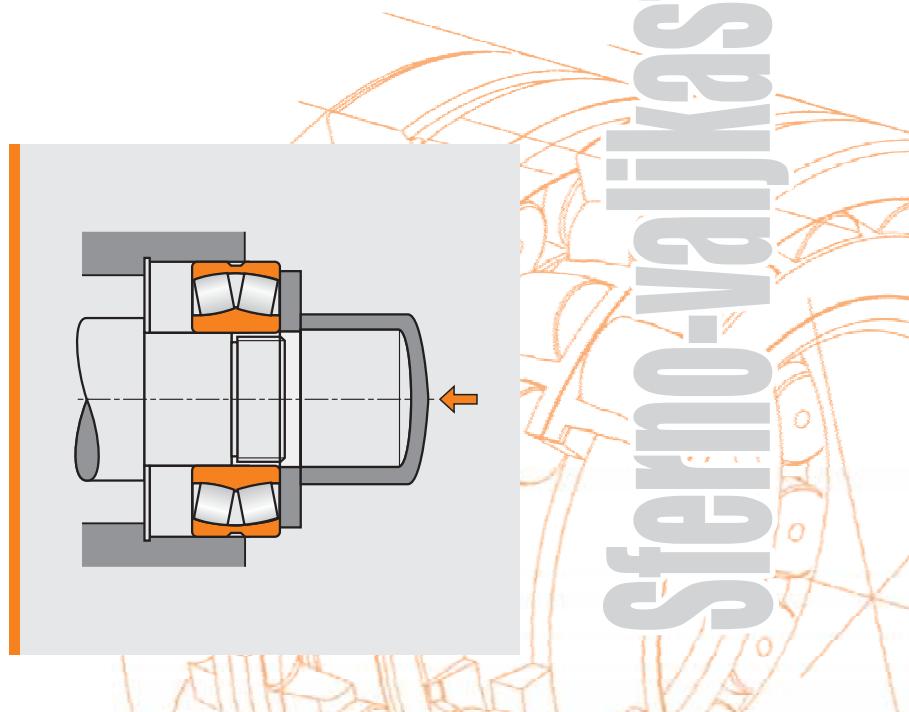

Paint brushes, brushes or lint-free cloths should be used for cleaning. Immediately after cleaning and the evaporation of the solvent, which should be as fresh as possible, the bearings must be preserved in order to avoid corrosion.

Rolling bearings are heavy-duty machine elements with high precision. In order to fully utilize their capacity, mounting and dismounting should be taken into consideration when selecting the bearing type and design and when designing the surrounding structure. For the rolling bearings to reach a long service life, the use of suitable mounting aids as well as utmost cleanliness and care at the assembly site are essential requirements.

## **Mounting bearings with cylindrical bore**

Blows with the hammer applied directly to the bearing rings must be avoided completely. In the case of non-separable bearings the mounting forces are applied to the ring which is to have a tight fit and which is first mounted. The rings of separable bearings however, can be mounted individually.

Bearings with a maximum bore of approximately 80 mm can be mounted cold. The use of a mechanical or hydraulic press is recommended.

## Groove and Lubricating Holes on Outer Ring Sferno-valjkasti ležaji - dvoredni

Should no press be available, the bearing can be driven on with hammer and mounting sleeve.

For self-aligning bearings, misalignment of the outer ring can be avoided by means of a disk which abuts both bearing rings.

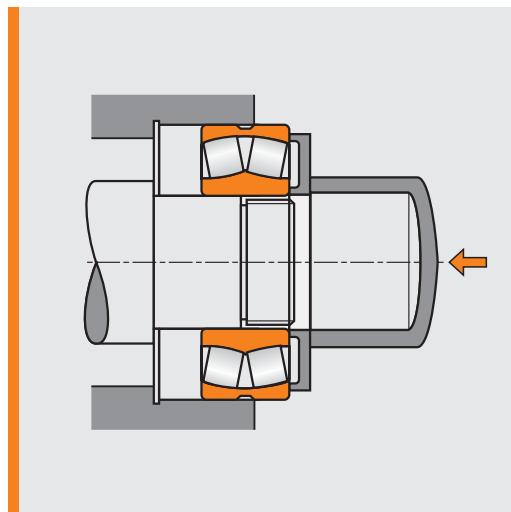

Bearings with a cylindrical bore for which tight fits on a shaft are specified and which cannot be pressed mechanically onto the shaft without great effort, are heated before mounting.

Bearings of all sizes and types can be heated in an oil bath.

The bearings are placed on a grate or hung up for them to heat uniformly.

Individual bearings can be heated provisionally on an electric heating plate. The bearing is covered with a metal sheet and turned several times.

A safe and clean method of heating rolling bearings is to use a thermostatically controlled hot air or heating cabinet. It is used mainly for small and medium-sized bearings. The heat-up times are relatively long. Induction heating devices are particularly suitable for fast, safe and clean heating.

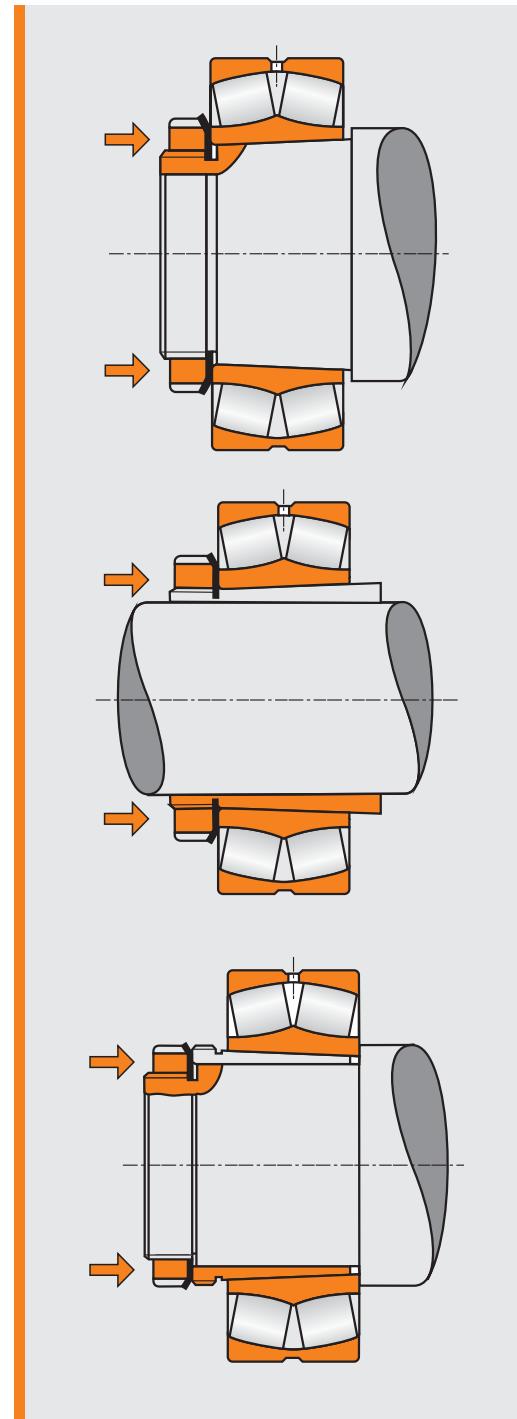

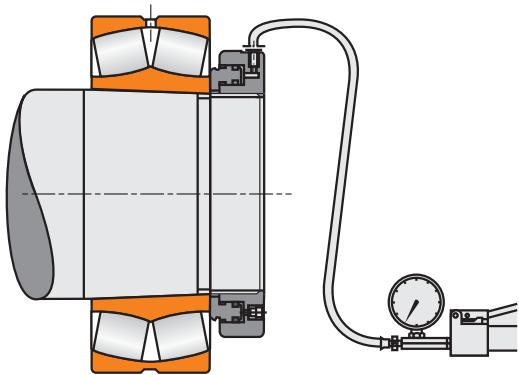

## Mounting tapered bore bearings

Rolling bearings with a tapered bore are either fitted directly onto the tapered shaft seat or onto a cylindrical shaft with an adapter sleeve or a withdrawal sleeve. The resulting tight fit of the inner ring is measured by checking the radial clearance reduction due to the expansion of the inner ring or by measuring the axial drive-up distance.

Small bearings (up to approx. 80 mm bore) can be pressed with a lockout onto the tapered seat of the shaft or the adapter sleeve. A hook spanner is used to tighten the nut.

It is advisable to use a hydraulic press for driving-up larger bearings or pressing them onto the sleeve.

# Groove and Lubricating Holes on Outer Ring

## Sferno-valjkasti ležaji - dvoredni

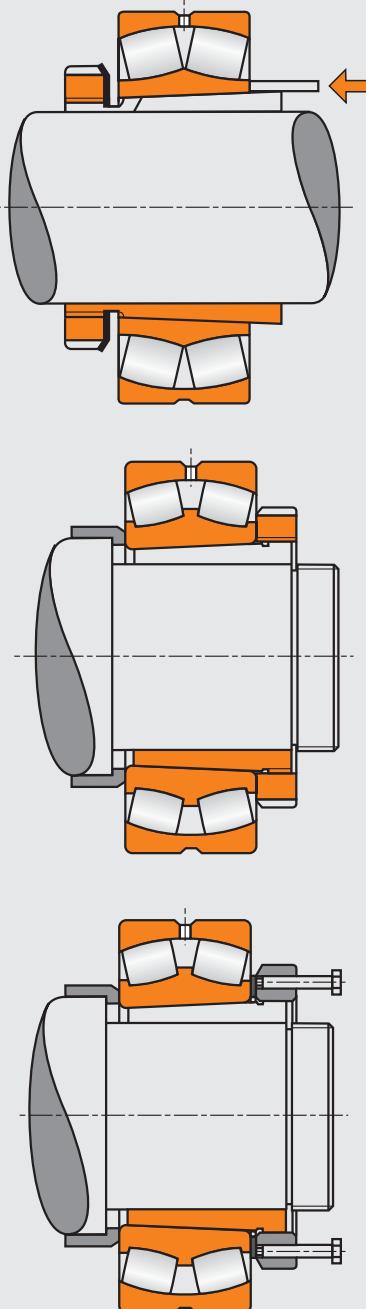

### Dismounting bearings with cylindrical bore

If the bearings are to be used again the extraction tool should be applied to the tightly fitted bearing ring. With non-separable bearings one should proceed as follows: if the outer ring is tightly fitted, the bearing and the housing are removed from the shaft and then the bearing is extracted from the housing by pressing off the outer ring. If the inner ring is tightly fitted, the shaft with the bearing is removed from the housing and then the inner ring is pressed off.

Mechanic extractors or hydraulic presses are suitable for extracting small bearings. Dismounting is facilitated when there are extraction slots on the shaft and housing. The extraction tool can then be applied directly to the tightly-fitted ring.

Induction heating devices are chiefly used for extracting the shrunk-on inner rings of cylindrical roller bearings. Heating occurs rapidly and the rings easily loosen without much heat reaching the shaft.

The bearings can also be pressed off cylindrical seats with the aid of the hydraulic method.

## Dismounting bearings with tapered bore

When the bearings are directly on the tapered seat or an adapter sleeve, the locking device of the shaft or sleeve nut is loosened first. The nut is then turned back by the amount corresponding to the drive-up distance. The inner ring is then driven off the sleeve or the shaft by means of a hammer and piece of tubing. When a press is used the adapter sleeve is supported and the bearing pressed off.

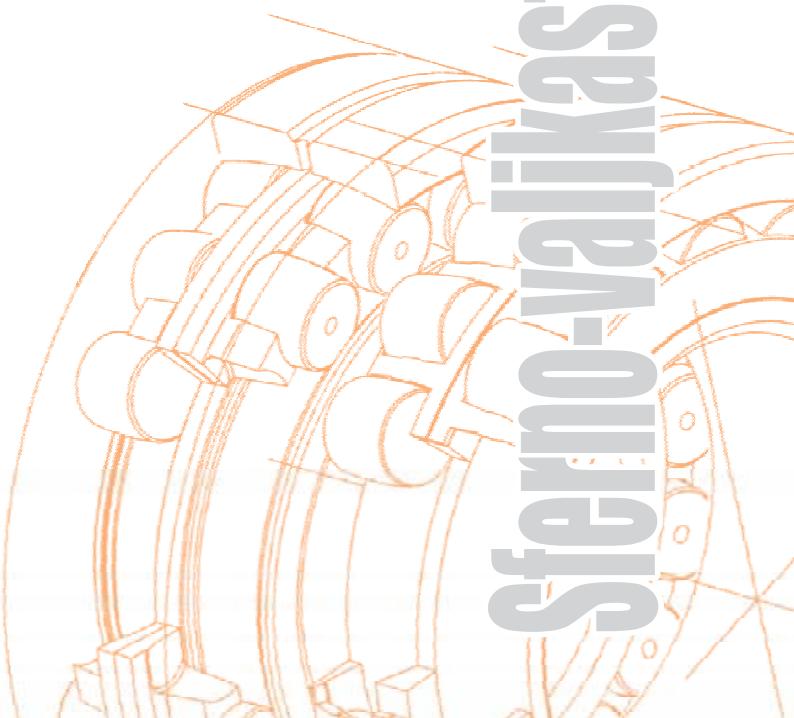

Withdrawal sleeve mounted bearings are removed by means of the extraction nut. High forces are required for large-size bearings.

The dismounting of withdrawal sleeves is much easier and more cost-effective with hydraulic nuts.

The hydraulic method is applied to facilitate the dismounting of large-size bearings.

Dismounting of large-size bearings is facilitated when the hydraulic device is applied.

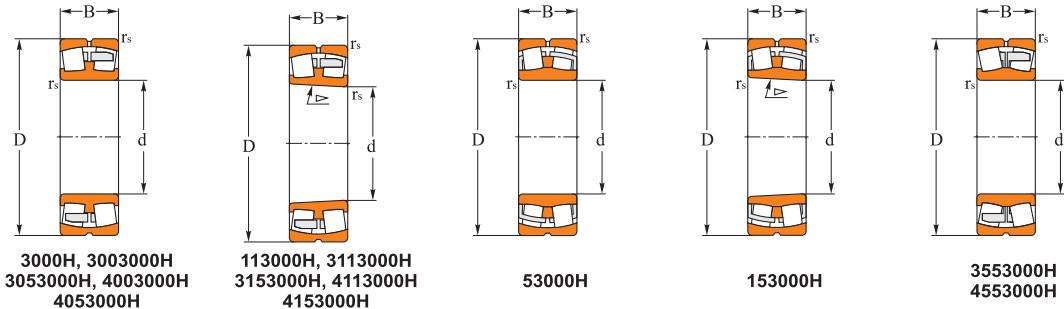

Oil is injected between the mating surfaces and enables the mating parts to be moved separately without risking surface damage. Large adapter and withdrawal sleeves already have the necessary grooves and bores. The required oil pressure has to be generated with a pump. For tapered bore bearings, oil has just to be pressed between the mating surfaces. Since the press fit is released abruptly, a stop such as a nut should be provided to control the movement of the bearing.

# Vibrating Screen Bearings

## Vibrating Screen Bearings Sferno-valjkasti ležaji - dvoredni

Vibrating screens, also known as shaker screens, subject bearings to extreme operating conditions. High «g» forces due to constant acceleration and impact from material on the bed require bearings with extra capacity and robust cages. The high loads cause deflection of the shafts and housings so the bearings must accommodate misalignment in operation. Lastly, the application subjects the bearings to high speeds and highly contaminated environments so the bearings must operate smoothly and have minimal friction.

These bearings can be used in mining, construction, aggregate, asphalt recycling, steel manufacturing, and general industrial equipment where heavy loads, vibration, and impact loads are common. Typical examples include vibrating screens and crushers.

Sremovaljivi kasti ležaji - dvoredni

## Features

### Asymmetrical roller design

- Reduced sliding friction
- Less tendency for roller to skew during operation
- Fewer internal forces in bearing

### Forged inner and outer rings

- Uniform steel grain structure
- Improved fatigue life

### Open end cage design

- Ease of assembly
- Facilitates lubrication

### Two-piece machined bronze retainer

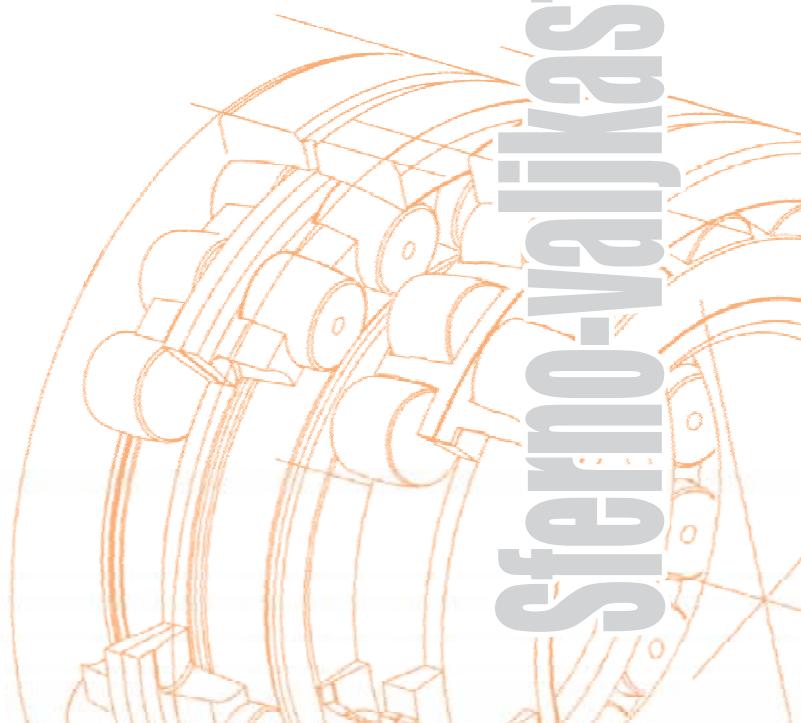

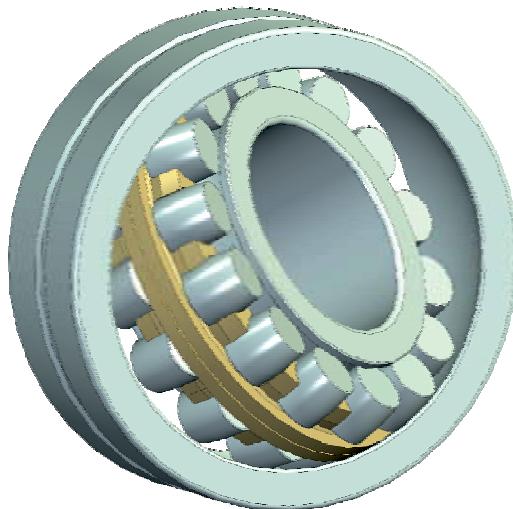

- Allows differential speed between roller sets reducing retainer stresses

### Inner and outer ring special heat treatment

- Improved fatigue life

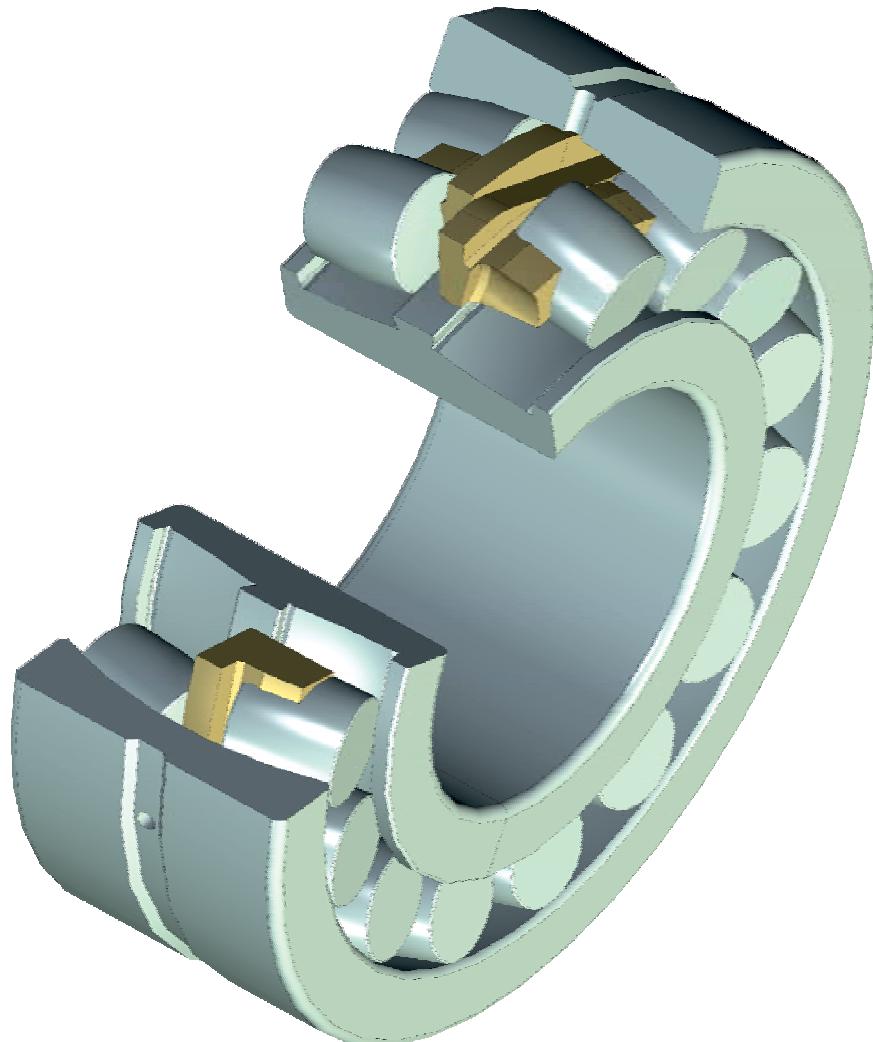

### Outer ring guided

- Higher operating speeds
- Improved lubrication of guiding surface

# Insulated Bearings

## Insulated bearings Izolovani ležajevi

Electrical pitting often occurs in bearings used in electrical equipment, such as motors and power generators, as a result of current leakage. An electrical current present near a bearing can flow to the inside of the bearing, causing sparks that damage the rolling contact surface, ultimately leading to bearing failure. This electrical pitting can be prevented with coated bearings.

Insulated bearings have been specifically designed to counteract electrical pitting. Coating the outer ring of the bearing provides a barrier (capable of resisting at least 100 M at 500 VDC) against any stray currents that would pass through the bearing.

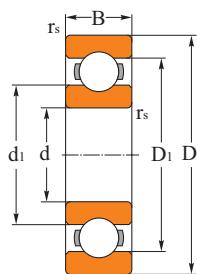

### The Coating Process

The plasma spraying process involves generating an arc between two electrodes to ionize a noble gas that is issued from the plasma torch. The resulting plasma jet is used to carry the injected aluminum oxide powder. This powder is melted by the heat and sprayed at high speed onto the outer ring. When applied in this manner, the oxide layer adheres extremely well to the base material. It is then sealed and ground to size. This unique technology has the following benefits:

- Plasma spraying is the most versatile thermal coating process – it produces high-performance coatings that deliver durability and reliability.
- The process applies coatings by injecting aluminum oxide powder into a high temperature gas stream. The plasma gas heats the powdered coating material to a molten state and sprays it onto substrates at high speeds.
- Plasma spraying is extremely flexible and is ideal for producing a wide variety of functional coatings.

# Spherical Roller Thrust Bearings

## Sferno-valjkasti aksijalni ležajevi

# Spherical Roller Thrust Bearings

Spherical roller thrust bearings comprise a consistent, entire manufacturing program both in dimensional and design series 292, 293 and 294, being in compliance with the international standards ISO by their design and manufacturing process. Quality management system of the whole manufacturing process of spherical roller thrust bearings is certified according to international standards series 9000.

Contrary to other thrust bearings the spherical roller thrust bearings loads are transferred from one raceway to the other under certain angle; this enables to accommodate also radial load in addition to axial load. Spherical roller thrust bearings are separable, therefore the shaft ring with cage and spherical rollers and housing(outer) ring can be installed individually. Another important feature of these bearings is their ability to tilt, which allows the possibility of alignment of shaft deflection and of verticality deviation to the housing.

Spherical roller thrust bearings are produced, in dependence to size and type, in two designs – in standard and E design. Outstanding feature of bearings of E design are their higher utility parameters, they represent a new generation of spherical roller thrust bearings. Being of identical main dimensions, they have upper utility properties. Both designs can be produced with machined brass cage M or with steel sheet cage J.

Should a bearing with machined brass cage, in which acting axial forces were accommodated also by sentence incomplete.

The inner space of spherical roller thrust bearings can be efficiently utilized. Therefore they are suitable for accommodation of great load at relatively high speed frequency. The bearings are capable to accommodate in addition to axial load also certain radial forces, anyhow these must be of smaller value than 55 percent of simultaneously acting axial force. Housing ring spherical raceway enables to align verticality deviations between the shaft and housing.

For their high utility values the spherical roller thrust bearings find wide application in many fields and industrial sectors.

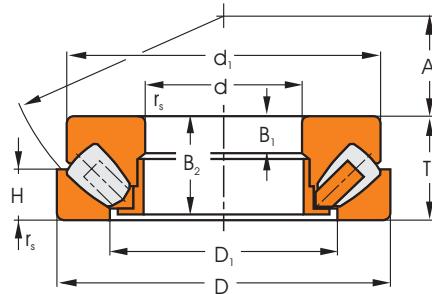

They are mainly used in the following installations:

- medium and heavy-duty forming machines
- ship drive shafts
- drilling rigs of all types and sizes
- medium and heavy-duty cranes including crane hooks
- pumps of medium and large sizes and capacities
- mining tunnelling machines and mining engineering
- heavy load swivelling turntables of installations in open pit mines and stone quarries
- power plant engineering (turbines, generating sets, electric motors).
